Release Notes:

AVG Business Antivirus Client 21.2

Release Date:

April 7, 2021

Summary

- Features, enhancements and bug fixes are part of this release.

Features/Enhancements

- Performance improvements — Your antivirus components should now load even faster
- Improved accessibility — Our interface is now better suited for impaired users
- Safer web browsing — Web Shield now supports scanning for threats in Google's QUIC protocol
- Friendlier CyberCapture — If you stumble upon a file we can't identify, CyberCapture can send it to our ThreatLabs for a detailed analysis. We've updated this entire process to make it easier than eveBetter
- Remote Access Shield — Not only do we now support Windows' Samba protocol, we've also added logs to show all remote connection attempts to your computer. (this component is not manageable from AVG Remote Administration)
- Firewall recognizes VPNs — Enhanced Firewall now knows when you're using a VPN and won't classify this as an unknown network. (AVG Internet Security only)
- Expanded Password Protection — We now protect your passwords in the beta versions of browsers, too. (Chrome, Edge, Firefox, and AVG Secure Browser)
- Rescue Disk improvements — Windows 7 users can celebrate knowing this feature works for them again, and we've improved its performance and made sure it properly cleans up related .DLLs for all users
- Bug stomping — Just the usual bug fixes that keep your antivirus going strong
- More informative threat alerts — If you get an alert, click 'See details' to see what type of threat it is (e.g., adware, ransomware, scam, etc.) and a brief description
- Tidier threat alerts — If you ever run into multiple threats at once, you'll no longer be bombarded with one alert after another. Instead, we've combined these into a single alert according to the shield that detected them
